
Digital Communications B

Finalità

To describe the theoretical foundation of the modern digital communication systems and the elements necessary to their design.

Programma

Part 1

Transmission systems with memory

General model of modulated signals. Sequence detection. Error probability evaluation for receivers based on sequence detection. Continuous phase modulations. Trellis-coded modulations. Reduced-state sequence detection. Linear and decision-feedback equalization.

Part 2

Advanced topics

Sequence detection in the presence of unknown parameters. Per-survivor processing. Turbo codes and iterative decoding. Factor graphs and the sum-product algorithm. Low-density parity-check codes. Space-time codes.

Attività d'esercitazione

Solution of previously assigned problems.

Modalità d'esame

Written and oral exam.

Propedeuticità

None
